	Common wallaby Grass	Austrodanthonia caespitose
	Spear grass (Tall)	Austrostipa pubinodis
	Common tussock grass	Poa labillardiereri

Latin

SEEDS

Sowing GRASS & MURNONG

- 1. Trays need to be filled with 2/3 potting mix suitable for native species
- 2. Place a 1/3 seed raising mix on top of potting mix, as a discrete level, don't mix.
- 3. Create furrows by slightly indenting a chop stick 5 cm apart.
- 4. Gently push grass seed head into soil with the awn visible.

 If awn is not visible available push seed gently into the seed raising mix.
- 5. Place seed raising tray into a water reservoir and with capillary action water will migrate from the bottom to the top of the mixture. This will take time.
- 6. Grass seeds should migrate down.
- 7. Mist lightly thereafter until germination.
- 8. It is important that the trays do not dry out at any point.
- 9. Germination approx.: 1-2 weeks

SEEDS

Sowing ACACIA

These need to have heat treatment prior to sowing.

- 1. Place seeds into an open glass beaker with 1 cm tap water.
- 2. Seeds that float indicate air has penetrated and may not germinate. Remove.
- 3. Boil jug of water to boiling point, allow 1-2 minutes before pouring into water containing seeds.
- 4. Leave for 12-16hours until the seeds have swollen.
- 5. Place swollen seeds onto a saucer and then proceed to create furrows in the trays with seed raising mix as per grasses.
- 6. Place seeds into the furrows 2 cm apart.
- 7. Place a light covering of seed raising mix, 4-6mm over the seeds.
- 8. Water tray from the bottom, as per Grasses.
- 9. Mist lightly thereafter until germination.
- 10. It is important that the trays do not dry out at any point.
- 11. Germination approx.: 1-2 weeks

Pricking out seedling. This needs to be undertaken with care.

- 1. Fill tubes with potting mix.
- 2. Use chop stick to make an indentation.
- 3. Carefully lift the seedling out of the tray so not to damage roots.
- 4. Holding green tip, place into the hole and add soil, fill to top.
- 5. Water lightly from above.
- 6. Place in light and sun to assist growth.

Heather Hesterman Project: CULTIVATE

All species are native plants found in Victoria.

TUBESTOCK

- 1. Lightly water from the top.
- 2. It is important that the tube stock does not dry out at any point.
- 3. Rotate tubes so that they receive even sunlight.
- 4. Place plants outside in full sun

Note: each tube needs to be correctly labelled.

CUTTINGS

- 1. Take softwood cuttings 8-10 in length, remove lateral leaves leaving a few at the top
- 2. Dip the heel into honey.
- 3. Fill tubes with potting mix, make and decent indentation with chop stick
- 4. Place cutting into the hole and add some potting mix to fill and top up
- 5. Water gently until soil is saturated
- 6. Place in sunlight and ensure that tube doesn't dry out.
